Outlook summary

See your day's agenda summarized below the Calendar view in Outlook.

Preview and prerelease AI features shown; subject to change. Sequences shortened for demonstration purposes. Available on all Windows 11 PCs with a Microsoft 365 Copilot requires a subscription.

Discussion: what we want to learn

- **Feature adoption:**

- Based on what you've seen, would you enable these Windows AI features for your users? Why or why not?
- What would need to be true for you to pilot this in the next 6–12 months? What would immediately slow adoption, regardless of feature value?
- Which scenarios feel valuable enough to justify rollout (e.g., Ask Copilot on Taskbar, Ask Copilot in File Explorer, improved Windows search, Click to Do with M365 Actions, Writing Assistance)?
- What concerns would give you pause before enabling these features org-wide? For example, trust in results, data handling (local vs cloud files), and user behavior or misuse

- **Admin controls & governance**

- As AI and agentic capabilities become native to OS like Windows, what control and governance model do commercial customers expect in order to deploy these capabilities with confidence at scale?
- Does the idea of a multi-layered control resonate with enterprise—where: Intune owns device / OS-level enablement and enforcement (“big knobs”), and Agent 365 owns agent-specific identity, permissions, and observability

- **Trust, data boundaries, and transparency**

- Does it matter to you where processing happens (on-device vs cloud), especially when files are local-only vs already in the cloud?
- What level of transparency or user awareness is required for you to feel comfortable enabling this? (e.g., what data is used, when uploads occur)?

Thank you!
